

ABSTRACT

1
2 A printer system for modifying the printer's output
3 includes a program for the printer which is not compatible with
4 the printer with a managing program for modifying the program.
5 A substitution table substitutes a portion of the program that
6 is not compatible and, a processor in the printer receives the
7 substitution table and modifies the program. The system uses a
8 method of printing with the non-compatible program by providing
9 a program not compatible with the printer and then creating a
10 character substitution table with characters compatible with
11 the printer. The character substitution table is stored in the
12 printer and the stored characters are adapted to the printer
13 with the non-compatible program.
